

ANYTHING. ANYWHERE. ANYTIME.

Codex is an ultra-high-resolution media recording system, designed to capture moving images and sound from digital motion picture cameras. Both portable and highly reliable, **Codex** can record in a variety of formats, from two channels of HD/2K digital film, all the way up to uncompressed 4K for the ultimate digital picture quality available today.

With its compact, rugged design, **Codex** is just as much at home on a location film shoot as it is in a studio machine room. Its removable media DiskPacks use RAID and mirroring for complete security and peace of mind. It has a built-in

touchscreen interface and dedicated transport controls, making **Codex** an easy to use and totally self-contained recording system.

It can interface with just about any digital camera system in use today, including the DALSA Origin®, Sony HD range, Thomson Viper FilmStream™, Panavision Genesis™ and Arri D-20. Its comprehensive array of industry-standard interfaces and flexible I/O configuration mean that **Codex** is essentially 'future-proofed' for complete compatibility with anything the future of digital cinematography might hold.

However, **Codex** is not *just* a recorder - instead it forms the core component of a complete workflow system. It can be configured in a number of different ways, providing anything from location digital media recording and shot-logging, to acting as a dedicated 2K 'screening system' and Production Server on-set, or it can be used as a fast, efficient media/metadata transfer and management system in a post-production environment. Its unique *Virtual File System* delivers recorded material by network immediately, to whoever needs it, in the exact formats they want, without any fuss.

So whether you are shooting digital film on location, working on VFX at full uncompressed resolution, offline editing sound and pictures, or simply checking shots on a laptop, **Codex** gives you what you need in the form you need it, when you need it - set-wide or worldwide.
